## I. Introduction

This report satisfies the 2021 annual reporting requirements of the State Water Resources Control Board Order WQ 2016-0068-DDW (the Order), Water Reclamation Requirements for Recycled Water Use adopted June 7, 2016. The Regional Water Treatment Facility currently is permitted to operate up to 16.2 million gallons per day (MGD).

To improve the reliability of the Tri-Valley's water supply, particularly in dry years, Dublin San Ramon Services District (DSRSD) and East Bay Municipal Utility District (EBMUD) created the DSRSD-EBMUD Recycled Water Authority (DERWA), which governs the San Ramon Valley Recycled Water Program and built the Jeffrey G. Hansen Water Recycling Plant and a backbone recycled water distribution system. The partnership also supplies recycled water to the City of Pleasanton.

## II. DSRSD/DERWA Recycled Water Treatment Processes

The DERWA recycled water system began delivering water to DSRSD and EBMUD customers on February 1, 2006 using a 3.0 MGD capacity microfiltration and ultraviolet disinfection facility (MF-UV). Capacity was expanded with the addition of a second process: continuous backwash sand filtration followed by ultraviolet disinfection (SF-UV). Five sand filters began producing recycled water on May 24, 2006. Today, the higher capacity SF-

*DERWA's recycled water plant is named the Jeffrey G. Hansen Water Recycling Plant for a former DSRSD director who was instrumental in bringing recycled water irrigation to the Tri-Valley.*

UV plant is used during summer when the demand for recycled water is highest. The MF-UV plant is used in winter when demand is lower, and it also serves as a backup to the SF-UV plant to meet summer peak demand.

In 2016, DERWA added a sixth continuous backwash sand filter and began supplying recycled water to the City of Pleasanton, California. The city submits a separate report regarding its recycled water customers.

In May 2018, DSRSD completed construction of the Recycled Water Treatment Facilities - Phase 2, which includes a ballasted flocculation process to provide pre-treatment of the wastewater treatment plant's secondary effluent prior to tertiary treatment by continuous backwash sand filters. In addition, the project increased the capacity of the ultraviolet disinfection system, as well as, the tertiary influent and effluent pump stations. As a result of these improvements, the Regional Water Quality Control Board (RWQCB or Water Board) approved a sand filtration tertiary treatment facility capacity of 12.3 MGD. The UV disinfection system was approved to operate at up to 17.6 MGD.

On December 4, 2018, DSRSD received approval from the San Francisco Bay Regional Water Quality Control Board (RWQCB) for a capacity increase for the RWTF to 12.3 mgd at a filter loading rate of five gpm/ft<sup>2</sup>. The approval was based on DSRSD's 2018 Title 22 Engineering Report for the Production, Distribution, and Use of Recycled Water (Engineering Report).

In 2020, a Title 22 Engineering Report was submitted to RWQCB to obtain approval to operate the sand filtration system at a loading rate up to 7.5 gpm (gallons per minute)/ft<sup>2</sup> to allow the Recycled Water Treatment Facility (RWTF) to operate up to 16.2 MGD. The testing conducted by staff in 2020 demonstrated that operation of the facility at the increased capacity met all the State Water Resources Control Board Division of Drinking Water (DDW) filter effluent water quality equivalency criteria. DSRSD received interim approval in early 2021 to operate at the increased capacity and updated the SCADA programming to automatically operate the system at the increased capacity, in accordance with permit requirements. While formal approval is still pending due to competing priorities at the State level, the formal approval is anticipated to be received in 2022.

The micro-filter ultraviolet disinfection (MF-UV) system was offline during the off-irrigation season in 2021. Instead of operating MF-UV, the sand filtration (SF-UV) system was able to address the demand in lower operating parameters which was previously met using the MF-UV system. An operational analysis was performed on the SF-UV and MF-UV systems and was completed in October 2021. The consultant recommendation is to cease operation and maintenance of the MF-UV system.

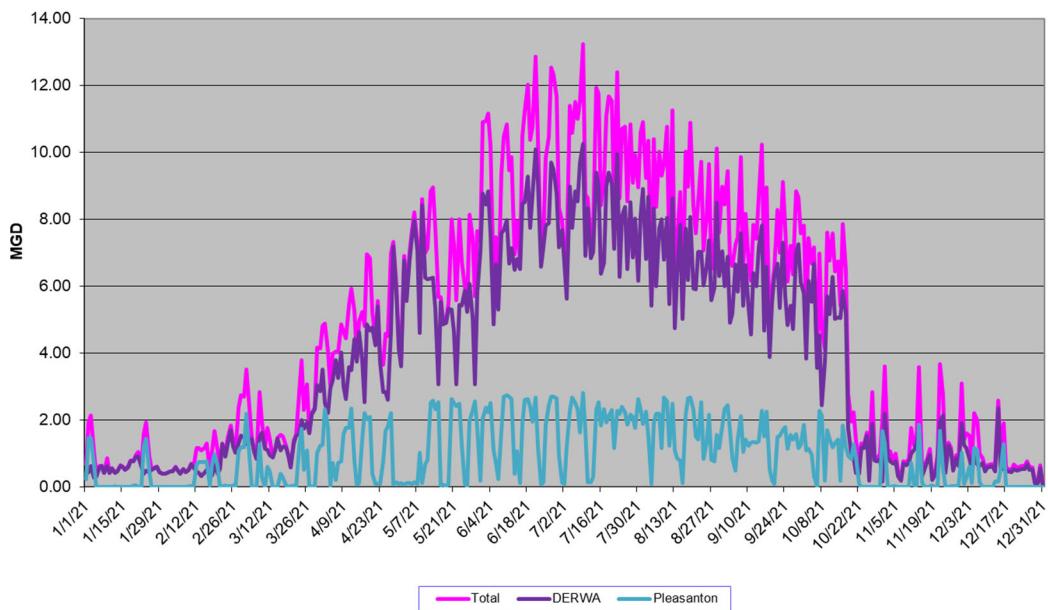

*In 2021 DSRSD receive approval to operate the Recycled Water Treatment Facility, including UV disinfection operations, at an increased capacity.*

reached a maximum daily delivery of 12.41 MG. This demand is comparable to the previous year record of 10.53 MG set on August 14, 2020.

The following graph and chart show the demand for recycled water in 2021, as well as the end use for the recycled water.

In 2021, DERWA facilities produced 5,769 acre-feet (AF) (1,880 million gallons (MG)) of recycled water (4,828 AF or 1,573 MG in 2020), which either was delivered to DSRSD, EBMUD, or City of Pleasanton customers (based on the production plant's PSR1 flow meter) or used at the production facility. During 2021, no potable water was used to supplement the supply to produce recycled water (2.4 MG of potable water was used in 2020). On July 9, 2021, the demand for recycled water

### 2021 DERWA Recycled Water Demand

Recycled Water Uses (MG)	2021 (in MG)	2020 (in MG)
DSRSD and EBMUD customers	1,388.53	1,304.11
City of Pleasanton customers	337.10	337.43
Contractor Fill Station	0.143	0.218
Residential Fill Station(suspended)	0.0	0.0
Facility Processes	38.688	49.874
Facility Landscaping	1.120	1.079
Total	1,765.58	1,692.71

### 2021 Season Highlights

January: Mean temperature was 48.6°F with a maximum recorded temperature of 78.3°F. The recorded rainfall totaled 3.4 inches. Recycled water production totaled 21.69 MG or 1.36 MGD. The MF-UV system ran 16 days while the SF-UV system ran in tandem with the MF-UV system for 2 days.

February: Mean temperature was 51.4°F with a maximum recorded temperature of 77.7°F. The recorded rainfall totaled 0.5 inches. Recycled water production occurred on 16 days during the month and totaled 36.58 MG or 1.55 MGD. The SF-UV system ran 7 days while the MF-UV system ran 10 days, with one day running both systems in tandem.

March: Mean temperature was 51.9°F with a maximum recorded temperature of 83.1°F. The recorded rainfall totaled 1.1 inches. The SF-UV system was put online 21 days and produced all the 90.89 MG, or 4.33 MGD, of recycled water.

April: Mean temperature was 56.2°F with a maximum recorded temperature of 85.5°F. The recorded rainfall totaled 0.2 inches. Recycled water production occurred daily during the month and totaled 174.87 MG, or 5.83 MGD – all produced by SF-UV system.

*The SCADA control system monitors recycled water production.*

May: Mean temperature was 62.0°F with a maximum recorded temperature of 96.3°F. Recycled water production occurred daily during the month and totaled 250.07 MG, or 8.07 MGD – all produced by the SF-UV system.

June: Mean temperature was 67.4°F with a maximum recorded temperature of 103.1°F. Recycled water production occurred daily during the month and totaled 293.58 MG, or 9.79 MGD – all produced using the SF-UV system.

July: Mean temperature was 70.7°F with a maximum recorded temperature of 105.4°F on July 10 as the peak for the year. Recycled water production occurred daily during the month and totaled 319.85 MG, or 10.32 MGD – all produced using the SF-UV system. The peak daily customer demand for the calendar year was recorded at 12.41 MG on July 9.

August: Mean temperature was 70.3°F with a maximum recorded temperature of 101.8°F. Recycled water production occurred daily during the month and totaled 271.80 MG, or 8.77 MGD – all produced using the SF-UV system.

September: Mean temperature was 68.6°F with a maximum recorded temperature of 100.6°F. Recycled water production occurred daily during the month and totaled 226.91 MG, or 7.56 MGD – all produced using the SF-UV system.

October: Mean temperature was 60.5°F with a maximum recorded temperature of 93.5°F. The recorded rainfall totaled 5.0 inches. Recycled water production occurred on 26 days during the month and totaled 166.61 MG, or 6.41 MGD – all produced using the SF-UV system. The SF-UV system continued to run as the recycled water demands remain high at a daily average of 4.33 MGD.

November: Mean temperature was 53.9°F with a maximum recorded temperature of 77.3°F. The recorded rainfall totaled 0.6 inches. Recycled water demands decreased to a daily average of 2.91 MGD. Recycled water production occurred on 11 days during the month and totaled 31.91 MG, or 2.24 MGD – all produced using the SF-UV system.

December: Mean temperature was 47.4<sup>0</sup>F with a maximum recorded temperature of 70.3<sup>0</sup>F. The recorded rainfall totaled 6.1 inches. Recycled water demands continued to decrease to a daily average of 0.88 MGD. Recycled water production occurred for 13 days and totaled 27.34 MG, or 2.10 MGD – all produced using the SF-UV system.

### III. Recycled Water Monitoring

The Order requires DSRSD to perform recycled water monitoring on UV transmittance, UV dose and treated recycled water turbidity on a continuous basis. Total coliform bacteria samples are conducted by grab sample on a daily basis. This monitoring data is then reported annually. The sample locations vary, depending on which recycled water treatment facility is in operation. Samples are collected at the SF-UV,

MF-UV, or Pump Station R1 (PSR1). *Samples of recycled water are collected as required by NPDES.* Collected samples are analyzed for total coliform, turbidity, dissolved oxygen, dissolved sulfides (if dissolved oxygen < 1 mg/l). Refer to Attachment B to see these results for the 2021 irrigation year. During the irrigation year, the minimum dissolved oxygen level in the recycled water produced was 6.86 mg/l, while the high was 7.56 mg/l. The recycled water conductivity ranged from 1342 to 1766 us/cm.

A total of 5,769 acre-feet (AF) (1,880 million gallons (MG)) of recycled water was produced and either delivered to DSRSD, EBMUD or City of Pleasanton customers (based on the production plant's PSR1 Flow meter) or was used at the production facility. During the 2021 irrigation season, the MF-UV plant operated on a total of 27 days (64 in 2020). The SF-UV plant operated on 232 days (266 in 2020). There were four days when both the MFUV and SFUV plants were in operation (29 in 2020). There were 286 days during 2021 when recycled water was being produced (322 in 2020).

The recycled water facilities are programmed to automatically bypass or cease production when the system detects a low UV dosage (< 80 mj/cm<sup>2</sup> MF-UV; < 100 mj/cm<sup>2</sup> SF-UV). The sand filtration ultraviolet disinfection system underwent an upgrade in 2018. The permitted UV dose remains at 100 mj/cm<sup>2</sup>. However, the system now has an operator adjustable target UV dose. The operator adjustable UV dose was installed with a minimum set point of 105 mj/cm<sup>2</sup>. Scada does not allow the operator to input a target dosage of less than 105 mj/cm<sup>2</sup> (100 mj/cm<sup>2</sup> is the permit dose). Scada is also programmed to place the SFUV facility in bypass if the actual system dose drops to 105 mj/cm<sup>2</sup>. This change gives the system some additional safety factor in regard to UV disinfection.

A review of the recycled water effluent data for the 286 operation days during 2020 irrigation season reveals three anomalies:

1. On July 13, 2021, there was an unplanned recycled water production outage. This was ultimately determined to be due to an overdosing of alum and polymer which caused sand to settle too fast and to coagulate in the sedimentation tank – the situation was exacerbated by a blockage in the BF sand feed system caused by wood chips and prevented sand from being added. Staff removed the blockage, adjusted chemical dosages and sand inventory in the BF system, and revised the storage location and sack size for BF sand to reduce the likelihood of future blockages.
2. On October 27, the DSRSD Jeffrey G. Hansen Water Recycling Facility delivered recycled water that did not meet disinfected tertiary total coliform standards. The data presented were from samples taken on October 22 and October 23. DSRSD determined the cause to be staining of quartz sleeves, took action to replace the stained sleeves, and modified the SF-UV system treating recycled water to adjust for staining on the quartz sleeves surrounding the SF-UV lamps. The delivery of recycled water was not discontinued; subsequent samples demonstrated that lower coliform results were achieved because of the modification.
3. The Ballasted Flocculation (BF) and Hydro Cyclone System (HCS) are operating within operational parameters, with 9 to 11 pounds of sand loss per million gallons treated, which is what would be expected based on recycled water production each year. However, during preventive maintenance (PM) of the recycled water facility, staff observed a significant amount of sand carryover into downstream processes in the sand filter influent channel, ultraviolet (UV) channel and Holding Basin 4 wet well. Additionally, a significant amount of BF sand was collected (approximately 85 cubic yards) during the cleaning of Digester #3 in December 2021. Due to its small size, BF sand does not settle in the grit tank. Because the carryover of BF sand into the SF-UV channel disinfection system has the potential to carry bacteria and viruses, staff is considering methods to remove the BF sand before it reaches downstream processes.

*DSRSD staff check the SFUV system to ensure recycled water continues to meet disinfection standards.*

Between DSRSD's SFUV and MFUV facilities, the laboratory conducted 405 Bacti samples during the 286 operational days when recycled water was produced. Below is a summation of the bacti results for the 286 days in 2021 when recycled water was produced.

### Summary of Recycled Water Coliform Results for the 2021 Irrigation Year:

Coliform Value (MPN)	<2	2	4	5	6	13	17	80	240	300	Total Bacti samples
MFUV Facility	21	4			1			1			27
SFUV Facility	350	18	5	1		1	1		1	1	378
Total Samples	371	22	5	1	1	1	1	1	1	1	405
% of samples in MPN Range	91.6%	5.4%	1.2%	0.2%	0.2%	0.2%	0.2%	0.2%	0.2%	0.2%	

## IV. Progress and Results of the Recycled Water Program Expansion

DSRSD currently has a moratorium on adding new connections to the recycled water system. Projects approved prior to the moratorium are allowed to connect to the recycled water system within the City of Dublin and Dougherty Valley area of San Ramon. Developers are installing recycled water mains within their developments and connecting irrigation services for streetscapes, parks, schools, commercial areas, and multi-family residential areas.

*Over 99% of the recycled water produced by DSRSD is used for irrigation purposes.*

### Recycled Water Supply

Recycled water demands have exceeded available supply during peak demand periods. Recycled water production can be supplemented with potable water at the water recycling plant and Regional Water Board approved points within the distribution system. In 2021, potable water was not used to supplement recycled water.

DSRSD has also secured a temporary supplemental untreated wastewater supply of approximately one million gallons per day from Central Contra Costa Sanitary District. The agreement allows for wastewater diversions for a maximum of five years.

### Salt and Nutrient Characterization for Landscape Application Uses

In coordination with the Regional Board it has been determined DSRSD does not need to perform characterization sampling since a [Salt Management Plan](#) and [Nutrient Management Plan](#) has been done in coordination with Zone 7, the water wholesaler for DSRSD.

## V. Residential Recycled Water Fill Stations

DSRSD closed the residential fill station on December 28, 2016, and it has remained closed through 2021.

## VI. Commercial Recycled Water Fill Stations & Recycled Water Hydrants

DSRSD's commercial recycled water fill station is located at the wastewater treatment facility and has been operational since 2007. Installation of recycled water fire hydrants in Dublin and Dougherty Valley began in 2008. Fill station and temporary hydrant users (aka temporary construction meter users) are required to obtain a recycled water-use permit from DSRSD. In 2014, the fill station was upgraded to a flow rate of 1,000 gallons per minute. Typical loads are between 2,000 to 4,000 gallons. Commercial users are given a personal identification number so they can access the fill station 24 hours a day, seven days a week.

*Permitted users of the commercial recycled water fill station use recycled water instead of potable water for acceptable uses.*

DSRSD has 21 recycled water hydrants located throughout central and eastern Dublin and Dougherty Valley. Customers are directed to use recycled water instead of potable water for acceptable uses listed in Title 22, such as dust control, soil compaction, street sweeping, surface washing, and landscape irrigation.

In 2021, there were seven commercial fill station users that utilized 0.143 MG of recycled water and 12 hydrant users that used 7.46 MG of recycled water.

## VII. User Compliance Program Review and Results

### Compliance Program Background

DSRSD has 355 recycled water irrigation sites, including eight new use sites and one carwash, that used 905.14 MG in 2021. Between 2020 and 2021, 12 irrigation meters were converted back to potable water from recycled water due to non-compliance with DSRSD's Standards and Specifications.

*DSRSD's recycled water irrigation sites include a carwash.*

Ordinance 301 and DSRSD's Recycled Water Use Guidelines outline the requirements and recommendations for customers to follow in order to achieve compliance with Title 22 and 2016 State Order WQ 2016-0068-DDW. After expanding recycled water distribution into established areas of Central and Eastern Dublin, DSRSD revised its [Recycled Water Use Guidelines](#) in February 2015 to address retrofit sites.

At this time, customers utilize recycled water for the following uses within DSRSD's service area:

- Landscape irrigation
- Dust control and construction grading
- Industrial Uses
- Pressure washing for surface cleaning
- Street sweeping

#### **Recycled Water Supervisor Training**

DSRSD was unable to provide in-person site supervisor training in 2021 due to the COVID 19 protocols, however, staff does provide individual training to new permitted users.

#### **Recycled Water Use Area Monitoring**

DSRSD staff performs periodic inspections of recycled water use sites to ensure compliance with the State recycled water use criteria. Furthermore, recycled water users are required to submit quarterly self-monitoring reports. The following tables – included under Attachment E – summarize DSRSD's use area monitoring and reporting activities for this reporting period:

1. Site Inspections & Corrective Actions
2. Recycled Water Users Bi-Monthly Usage
3. Recycled Water Users Acreage Applied & Application Rate
4. List of New Recycled Water Use Sites
5. Spring, Fall & Winter Self-Monitoring Report Results
6. Discharge Off-Site List

## **VIII. Attachments**

The following attachments summarize the 2021 recycled water irrigation season:

- Description of Recycled Water Treatment Facilities (Attachment A)
- Dissolved Oxygen, Coliform, and Conductivity analysis (Attachment B)
- Flow and Turbidity Data – MFUV Plant (Attachment C)
- Flow and Turbidity Data – SFUV Plant (Attachment D)
- Irrigation Site and Compliance Records for DSRSD (Attachment E)
- Irrigation Site and Compliance Records for EBMUD (Attachment F)

## **Attachment A**

### **Description of Recycled Water Facilities**

#### **Ballasted Flocculation**

In advance of tertiary treatment by continuous backwash sand filters, secondary effluent from the DSRSD wastewater treatment plant receives pre-treatment via a ballasted flocculation and clarification system. Constructed in 2018, this system removes turbidity and suspended solids from the secondary effluent, making it easier to filter via sand filtration. This process has two treatment trains, each with a treatment capacity of 11.1 MGD for a total secondary effluent pre-treatment capacity of 22.2 MGD.

*DSRSD basins stand ready to receive and store secondary effluent supply until it begins the ballasted flocculation process.*

Ballasted flocculation pre-treatment process is a compact clarification system that utilizes micro sand as a ballast for floc sedimentation. The primary role of the micro sand in the ballasted flocculation process is to provide a ballast in the formation of large, stable, high-density floc. The ballasted floc has considerably higher settling velocities than conventional floc, allowing significantly higher clarifier overflow or rise rates. Overall, these factors provide a process that is extremely efficient in the treatment of water. It is stable with changes in secondary effluent water quality and relatively easy to operate and optimize.

## SF-UV Facility

Sand filtration-ultraviolet disinfection (SF-UV) treatment processes reduce turbidity, remove suspended solids, and inactivate pathogens. The SF-UV tertiary treatment plant has a reliable, sustainable capacity of 16.2 million gallons per day (MGD). Fully treated and chlorinated secondary effluent from the wastewater treatment plant flows to a diurnal storage basin. A portion of that secondary effluent is pumped to the SF-UV facilities to produce recycled water. The remaining secondary effluent is pumped to the Livermore Amador Valley Water Management (LAVWMA) facility and then to East Bay Dischargers Authority (EBDA) system for discharge into San Francisco Bay through a deep water outfall.

*Access plates hide six sand filters where flocculated water flows upward through 80 inches of continuously backwashed sand.*

SF-UV treatment processes are as follows:

- Screening – Small material and plastics remaining in the fully treated secondary effluent are removed by a 2mm band screen.
- Coagulation – Coagulant chemical(s) are added to the tertiary influent and mixed into the flow using high-energy mechanical mixers; this causes fine particulates in the water to coagulate and begin to form into small particles.
- Flocculation – Coagulated water is gently mixed in two flocculation tanks using low-energy mechanical mixers to promote agglomeration of small particles into larger particles that can be easily filtered from the water.
- Filtration – To remove the particles, flocculated water flows gently up and through an 80-inch sand bed in one of six, up-flow, continuously backwashed, granular sand filters.
- UV Disinfection – Filtered water flows through two parallel UV channels for disinfection and inactivation of viruses and bacteria. The SF-UV system is a Xylem-Wedeco system, model TAK55 M 10-6(8)/143 x 5i2(3)W. Each channel has five banks of UV bulbs. Each bank has 140 bulbs.

## MF-UV Facility

Microfiltration-ultraviolet disinfection (MF-UV) treatment processes reduce turbidity, remove suspended solids, and inactivate pathogens. This MF-UV tertiary treatment plant is designed for a treatment capacity of 2.5 million gallons per day (MGD). MF-UV treatment processes filter all particles larger than 0.2 microns from the secondary effluent. A portion of unchlorinated secondary effluent is conveyed from just upstream of the wastewater plant's chlorine contact tank by MF transfer pumps to the microfiltration influent pump wet well. The remaining final secondary effluent is pumped to the Livermore Amador Valley Water Management (LAVWMA) and East Bay Dischargers Authority (EBDA) systems for discharge into San Francisco Bay through a deep water outfall.

*Five microfiltration units remove all particles greater than 0.2 microns.*

MF-UV treatment processes are as follows:

- Screening – A 500-micron screen removes small materials and plastics from the final secondary effluent.
- Filtration – The micro filters remove all particles greater than 0.2 microns. The system consists of five filtration units with an instantaneous capacity of 0.75 MGD and a net capacity of 0.50 MGD. Each membrane cartridge contains 18,000 hollow fibers membranes called lumens (0.5 mm diameter with a nominal pore size of 0.2 micrometers). Water passes from outside the membranes through the pores and into the lumens and exits as filtrate. The system feed pressure is typically between 25 and 35 psi.
- UV Disinfection – Filtered water flows through a UV channel for disinfection and inactivation of viruses and bacteria. The MF-UV system consists of ten Ondeo Degrement 40VLS UV modules. Each module has five rows of eight lamps, for a total of 40 lamps per module.

The MF-UV plant is operated when the demand for recycled water is less than 2.2 MGD. If the demand is greater than 2.2 MGD, the high capacity SF-UV plant is turned on. After treatment at either facility, the filtered and disinfected water is conveyed off site to customers through the DERWA recycled water distribution system.

Note:

Sampling Locations:

MFUV - microfiltration-uv disinfection channel

SFUV#1 - sand filter-uv disinfection channel #1

SFUV#2 - sand filter-uv disinfection channel #2

SFUV - combined SFUV#1 and SFUV#2

PS1 - combined MFUV and SFUV

## **Results from Spring 2021 User's Recycled Water Self-Monitoring Reports**

*Attachment E - Table 4: Results from Spring 2021 User's Recycled Water Self-Monitoring Reports*

<b>Standard observations:</b>	<b>Sites reported violations</b>	<b>When deficiencies were corrected:</b>	<b>How deficiencies were corrected:</b>
a. Evidence of runoff of recycled water form the site	4	After and During Self Monitoring Inspections	Adjust Nozzles, Replace broken heads
b. Odor of wastewater origin from irrigation site	1	No Correction was done Odor Dissipated	odor due to stagnate water, after 1st station was run the odor was undetectable.
c. Evidence of ponding of recycled water, and evidence of mosquitos breeding within the irrigation area due to ponded water	2		Adjusted irrigation schedule, Replaced with smaller emitters, installed drainage area.
d. Warning signs properly posted to inform public that irrigation or water use is recycled water and is not safe for drinking	3		New signs were purchased and installed according to standard.
e. Has there been any construction or have there been modifications done on the property within the last six months?	14		

## **Results from Summer 2021 User's Recycled Water Self-Monitoring Reports**

*Attachment E - Table 4: Results from Summer 2021 User's Recycled Water Self-Monitoring Reports*

<b>Standard observations:</b>	<b>Sites reported violations</b>	<b>When deficiencies were corrected:</b>	<b>How deficiencies were corrected:</b>
a. Evidence of runoff of recycled water form the site	7	After and During Self Monitoring Inspections	Adjust Nozzles, Replace broken heads
b. Odor of wastewater origin from irrigation site	0		
c. Evidence of ponding of recycled water, and evidence of mosquitos breeding within the irrigation area due to ponded water	1		Adjusted irrigation schedule, Replaced with smaller emitters, installed drainage area.
d. Warning signs properly posted to inform public that irrigation or water use is recycled water and is not safe for drinking	8		New signs were purchased and installed according to standard.
e. Has there been any construction or have there been modifications done on the property within the last six months?	17		

## **Results from Fall 2021 User's Recycled Water Self-Monitoring Reports**

*Attachment E - Table 4: Results from Fall 2021 User's Recycled Water Self-Monitoring Reports*

<b>Standard observations:</b>	<b>Sites reported violations</b>	<b>When deficiencies were corrected:</b>	<b>How deficiencies were corrected:</b>
a. Evidence of runoff of recycled water form the site	4	After and During Self Monitoring Inspections	Adjust Nozzles, Replace broken heads
b. Odor of wastewater origin from irrigation site	2		
c. Evidence of ponding of recycled water, and evidence of mosquitos breeding within the irrigation area due to ponded water	1		Adjusted irrigation schedule, Replaced with smaller emitters, installed drainage area.
d. Warning signs properly posted to inform public that irrigation or water use is recycled water and is not safe for drinking	7		New signs were purchased and installed according to standard.
e. Has there been any construction or have there been modifications done on the property within the last six months?	11		

## **Results from User's Recycled Water Self-Monitoring Reports**

*Attachment E - Table 4: Results from Winter 2022 User's Recycled Water Self-Monitoring Reports*

<b>Standard observations:</b>	<b>Sites reported violations</b>	<b>When deficiencies were corrected:</b>	<b>How deficiencies were corrected:</b>
a. Evidence of runoff of recycled water form the site	1	After and During Self Monitoring Inspections	There are breaks throughout the site, we have documented and will be making repairs upon approval
b. Odor of wastewater origin from irrigation site	1		
c. Evidence of ponding of recycled water, and evidence of mosquitos breeding within the irrigation area due to ponded water	0		
d. Warning signs properly posted to inform public that irrigation or water use is recycled water and is not safe for drinking	3		Need to purchase new signs.
e. Has there been any construction or have there been modifications done on the property within the last six months?	8		

## Clean Water Program

*Summary of Usage Application for Calendar Year 2021*

Application Type	No. of Sites	Area (Acres)	Amount Distributed (MG)	% of Total Reuse Flow
<b><u>LANDSCAPE IRRIGATION</u></b>
